The Frequency Domain Analysis of MP3 Decoders

Thesis directed by Associate Professor Catalin Grigoras

ABSTRACT

This research study aims to further the study of the MP3 format by adding another layer to the analysis process. Previous studies have demonstrated the padding of MP3 files (Zero Level Samples) to show generations of compression. This study offers an examination that explicitly demonstrates what happens in the frequency domain, specifically with the cutoff frequency.

The research test files involved 90 MP3 files recorded using three MP3 recording devices within the same acoustic environment. Various transcoding applications converted the MP3 audio streams to WAV Pulse Code Modulation (PCM) files. The audio files were then analyzed using the Long Term Average Sorted Spectrum (LTASS) to display variations in cutoff frequencies between transcoding tools.

The form and content of this abstract are approved. I recommend its publication.

Approved: Catalin Grigoras

DEDICATION

This thesis is dedicated to my wife Krystal Savage, and my daughter Briella Savage. I wouldn't be where I am today without you.

ACKNOWLEDGEMENTS

I'd like to thank Leah Haloin as well as all of my professors over the years (CAM & NCMF) Greg Wales, Lorne Britzter, Catalin Grigoras, Jeff Smith, Cole Whitecotton. You all have helped me a lot between questions, one on one advisory, experience and opportunities. Thank you for doing what you do.

CHAPTER I

INTRODUCTION

Brief MP3 Overview

MP3 is an acronym that stands for MPEG Audio Layer III, a lossy compression standard created by Karlheinz Brandenburg, a Moving Picture Experts Group member. The purpose of the MP3 codec was to reduce the file size of lossless audio files while keeping as much quality intact as possible. The reduced file size allowed enthusiasts to save space on their storage devices, thus enabling them to store more data and or transfer files more easily online.

In addition, the codec reduces file size by removing information in the frequency domain (of the audio) that the human ear does not detect using psychoacoustic techniques such as frequency masking.

The MP3 algorithm had a significant impact in the early 1990s. Then, hard drive capacity was not as big as we have today and your typical song could range anywhere from two to four minutes in length. Pair that with 56-128kbps internet download speeds, and you were in for a lengthy wait. To put this into perspective, consider the following table as it demonstrates the difference in file size between a WAV and MP3 file after the bit rates are adjusted.

Table 1: Raw Audio Example

Format	Duration	Sample Rate	Bit Depth	Channels	File Size
WAV	3 Min	44100 kHz	16 bit	2	31.752 MB

Table 2: Compressed Audio Example

Format	Duration	Sample Rate	Bit Rate	Channels	File Size
MP3	3 Min	44100 kHz	320 kbps	2	7.2 MB

77.3% reduction in file size in comparison to the Wav file

Table 3: Compressed Audio Example

Format	Duration	Sample Rate	Bit Rate	Channels	File Size
MP3	3 Min	44100 kHz	128 kbps	2	2.88 MB

90.9% reduction in file size size in comparison to the Wav file

The file size of an MP3 can be controlled by adjusting the bitrate, number of channels and sample rate. Bit Depth and Sample Rate determine the original recording's quality. The higher the bit depth, the higher the signal to noise ratio and dynamic range. A higher Sample Rate equates to a more accurate recording.

When a Wav file is encoded to MP3, the sample rate and bit depth transfer over as well, but it's not exact. If the bit depth were reduced from 16 bit to 6 bit, there would be a highly noticeable degradation in audio quality. To keep as much of the audio quality intact, you adjust the bit rate (bits per second) instead of bit depth (bits per sample).

Brief MP3 Decoder Overview

MP3 decoders are used to convert MP3s so they can be played back via software/Hardware MP3 players. The decoder can also convert the MP3 to a different format such as: AIFF, WAV or other formats. Information lost in the MP3 encoding process cannot be recovered when converted to the previous format. Some handheld recorders come with proprietary software for editing, encoding and decoding audio files, others will provide a list of recommended software.

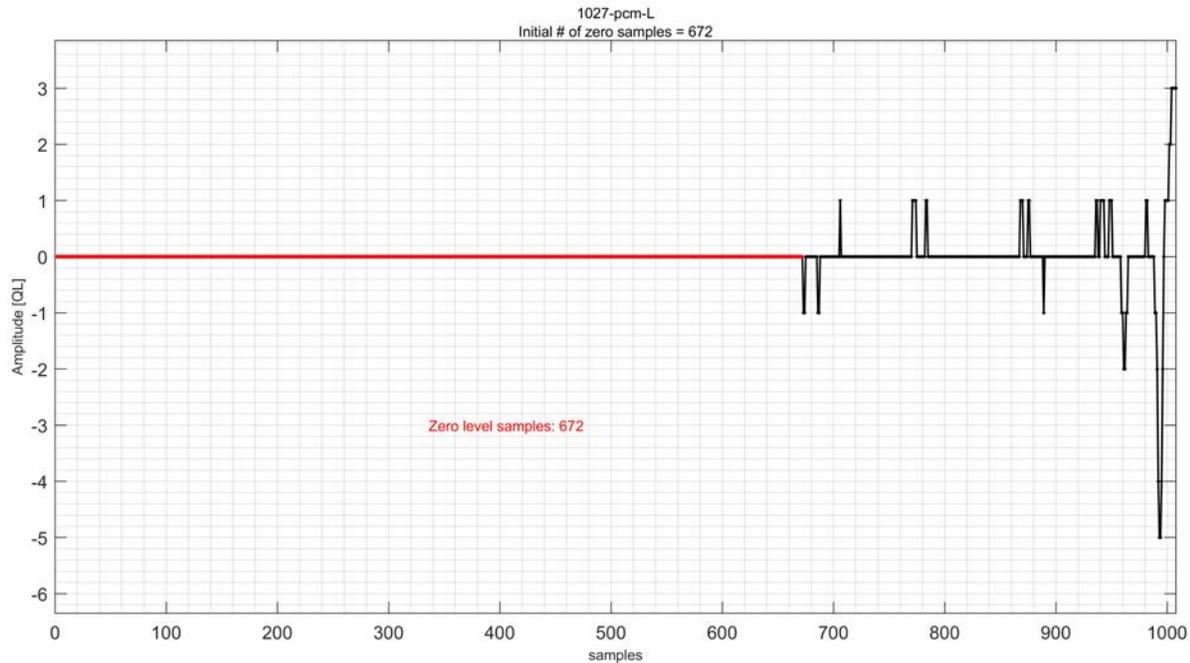

Previous Research

Literature Review

We understand from previous studies that MP3s (lossy format) have silence and or padding added to the files, known as Zero Level Samples (ZLS), which can indicate the generation of compression that exists within an MP3 file.

The methodology behind ZLS discussed in ‘Analysis of Zero-Level Sample Padding of Various Mp3 Codecs (Berman, Josh. 2013)’ requires MP3 files to be taken from its source (recording device) and transcoded by a decoder to a WAV file. The Wav file is then analyzed using The Long Term Average Sorted Spectrum (LTASS), noting the number of zeros.

Here is an example of MP3 padding

Left channel of Marantz Recording, decoded with Adobe Audition 3.0.1

The original hypothesis was that each generation of compression would introduce more padding (zeros) added to the compressed audio files. Both Berman and Yancy concluded that the results from their research did not display an increase in zeros per generation of compression across all applications used. It's for this reason that the analysis 'Zero Level Samples' could not be used on its own for authenticating an MP3 file.

Berman states "The MP3 standard states certain things that make an MP3 file readable by any decoder, however each decoder may decode the information differently". This is one gap in the study of MP3s that should be explored.

Purpose of the Study

The study aims to expand on previous research of MP3s and decoders by determining if there are any noticeable differences in the frequency domain of the audio file. Specifically, the cutoff frequency when transcoding the audio file from MP3 to WAV PCM using different transcoding tools. Hopefully, this study can be used as an aide alongside The Zero Level Samples Method to further audio authentication purposes.

CHAPTER II

MATERIALS

The MP3 Recording Devices Used

The following are recorders used in this study.

Table 4: Recording Devices

Recording Device	Kbps	Channels
Marantz PMD620	64/128/192	2 (Stereo)
Sony IC Recorder (ICD PX820)	128/192	2 (Stereo)
TASCAM DR-07	64/128/192	2 (Stereo)

The Transcoding Applications Used

The following applications in the table below were used to transcode the MP3s recorded with the recorders in the Table 4.

Table 5: Transcoding Applications

Application	Version/Build	MP3 Codec
Adobe Audition	3.0.1	Adobe
Adobe Audition 2021	Build 14.4.0.38	Adobe
dBpoweramp	16.6 [64-bit]	LAME 3.100
FFmpeg	v.git-2020-08-31-4a11a6f	LAME 3.100
iZotope RX9 Advanced	V9.1.0.1175 [64-bit]	LAME 3.99r
NCH Switch Plus	v.9.47	LAME 3.99r
Reaper	v.6.25	LAME 3.99.5/3.99r
SUPER	v.2000/Build 77	LAME 3.99.5

Each transcoding application has a MP3 decoding codec, this is needed to transcode the recorded MP3s into WAV files for LTASS analysis. All but two of the transcoding tools use the LAME (LAME Ain't an MP3 Encoder). LAME is an open source codec (free to the public) that allows MP3 encoding and decoding. Adobe uses its own proprietary codec for Adobe 2021 and 3.0.1.

Throughout this study, transcoders with the exception of Adobe Audition 3.0.1 and Adobe Audition 2021 may be referenced by shorthand or partial names. Table 5 shows Reaper v.6.25 as having two versions of lame, 3.99.5 and 3.99r. which were discovered during HEX analysis.

CHAPTER III

METHODOLOGY

The steps and procedures used to conduct this study revolve around recording 30 seconds (or more) of audio in the same acoustic environment using multiple handheld MP3 recorders with their factory stock microphones. The selection of audio recorders, recording environment and transcoding tools represented those found in a real-world environment.

The next step was to create forensic copies of all recorded audio files. This way, the original recordings remain persevered. Subsequently, the process involved creating several transcoded audio files with different transcoding applications.

Lastly, all transcoded audio files and original MP3s recorded by the MP3 recorders were analyzed and then documented, emphasizing the results in the frequency domain, the cut-off frequencies (COF).

In addition, the study does not provide the original MP3 cut-off frequency signature for each recording device as an extraction process does not exist at the time of this study.

Table 6: Transcoding Specifications:

Rate	Bit Depth	Mono/Stereo
44100kHz	16 Bit	Stereo

Audio File Analysis Process

The analysis of all audio files used the Long-Term Average Sorted Spectrum (LTASS). LTASS is the sorted version of Long Term Average Spectrum (LTAS) which displays an averaged representation of an audio recording. The reason why I'm analyzing the data using LTASS is for accuracy and to eliminate biasness and or false perception.

Recorders Used and Recording Settings

These recorders were chosen for this study because of their accessibility, ease of use and their features: Onboard stock microphones, battery powered and the ability to record at different settings.

MARANTZ – PMD620

- 64 kbps
- 128 kbps
- 192 kbps

SONY ICD PX820

- 128 kbps
- 192 kbps

TASCAM DR-07

- 64 kbps
- 128 kbps
- 192 kbps

The Sony ICD PX820's 64kbps recordings were omitted because they were mono and not stereo as needed for this research.

Looking at Fig 2 there are two concatenated spectrograms of recording DR000227. Fig 2.1 displays the same files, but zoomed in. The recording specifications for this file are as follows

Recorder: TASCAM DR-07 **Recording Spec:** 128 kbps **Transcoders used:** SUPER and Reaper v6.25.

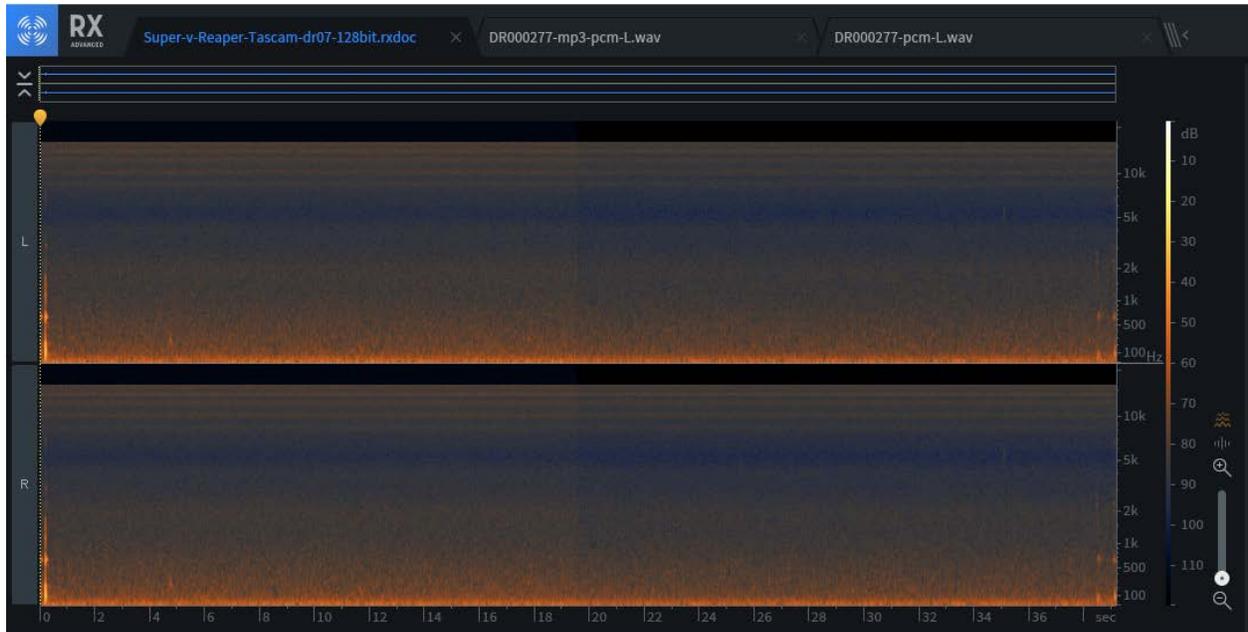

Figure 2: Concatenated Spectrogram view of SUPER (Left) and Reaper v6.25 (Right)

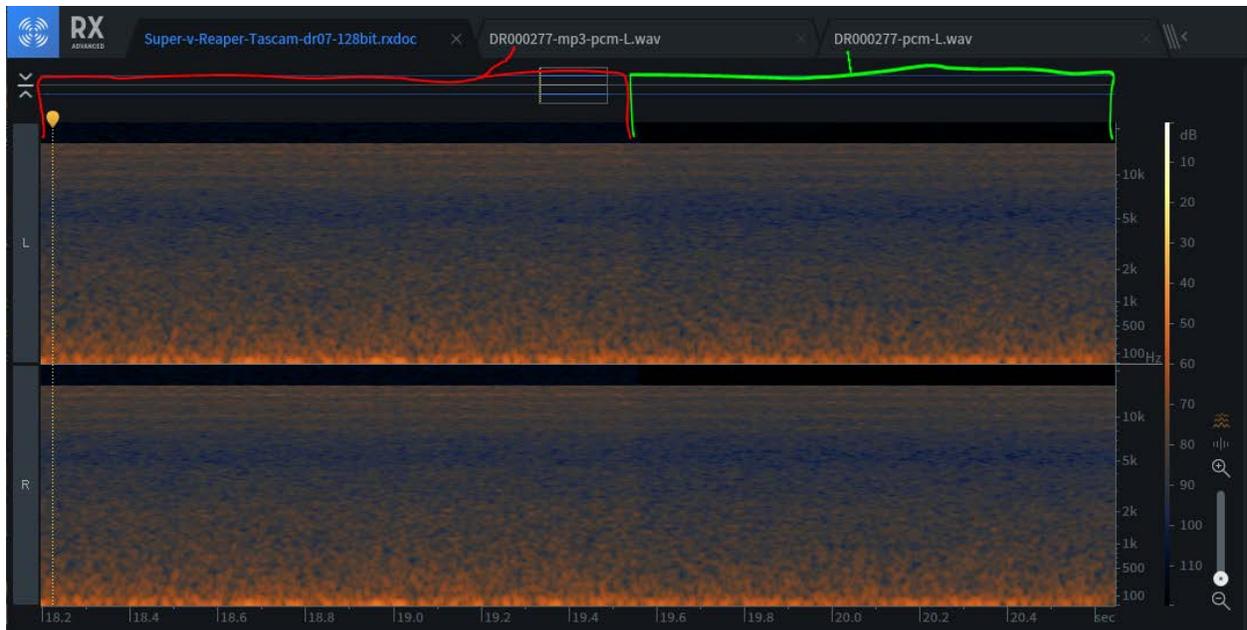

Figure 2.1: Concatenated Spectrogram view of SUPER (Left) and Reaper v6.25 (Right) Zoomed

The standard for authenticating MP3 files provides a procedure to follow and gives labs the freedom to use tools of their choice. However, different tools will equate to different results.

CHAPTER IV

RESULTS

The charts below summarize the test results by a test recording device, bit rate setting, and transcoding software tool based upon quantitative data from LTASS analysis.

The analysis of file 1027. MP3 display 3 transcoders sharing the same left and right cut off frequencies. Adobe Audition 3.0.1, dBpoweramp and FFmpeg use LAME 3.100 an Adobe uses its proprietary codec and share the following COFs Left = 7895/Right = 7981.

After analyzing file 1028.MP3 two of the previous three transcoders share COFs. Adobe Audition 3.01 and dBpoweramp COFs are $L = 7891/Right = 7892$.

Adobe Audition 2021 shows the same COF for its left and right (7888) channel when dealing with file 1027.MP3, but the left and right channel differ on file 1028.MP3. COF $L = 7890/R = 7887$.

File 1029.MP3 Adobe Audition 3.0.1 and dBpoweramp share the same COFs for the left and right channel (7896/7893). Izotope RX9 has the same COF for the left and right channel (7896/7896) and Reaper displays (7894/7894).

File 1030.MP3 Adobe Audition 3.0.1, dBpoweramp and FFmpeg share the same COFs (7893/7895). Izotope RX9 and Reaper no longer have the same COF in their respective left and right channels

The analysis of the Marantz PMD 620 recorder at 128kbs displays Adobe Audition 3.0.1, dbpoweramp, and FFmpeg share the same left and right cut-off frequencies on the following recordings.

1001.MP3: 19605/19601

1002.MP3: 19605/19607

1004.MP3:19606/19609

1006.MP3:19608/19601

1010.MP3:19599/19607

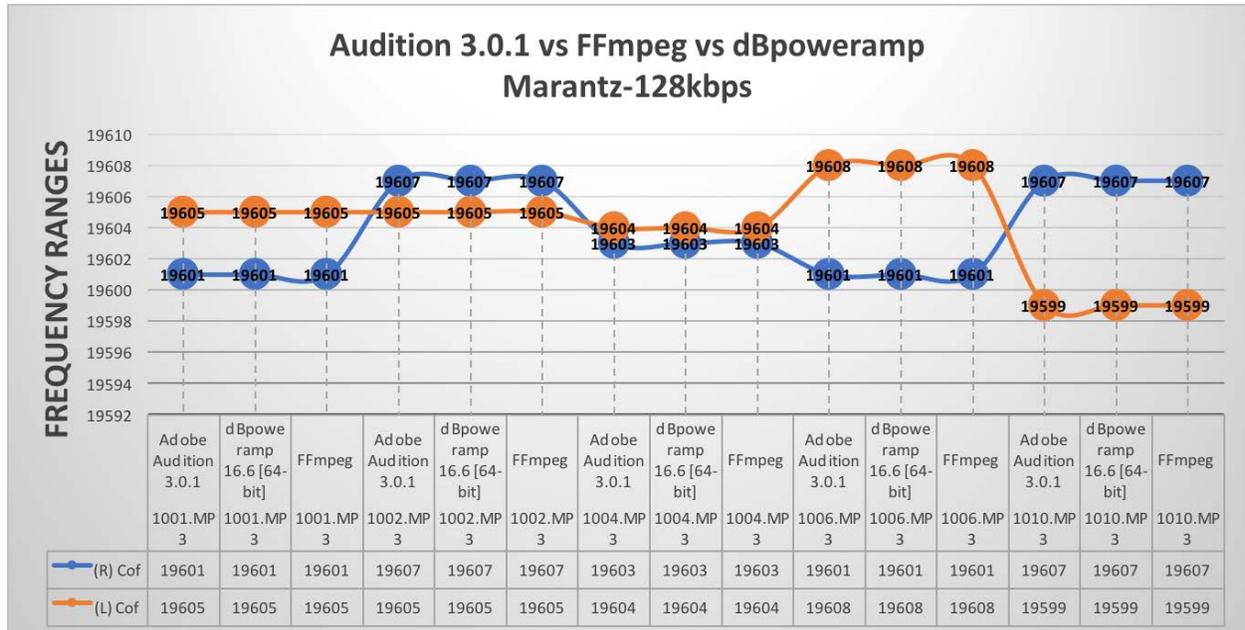

Figure 3: Chart displays relationship between Adobe Audition 3.0.1, FFmpeg and dBpoweramp

In 20% of the recordings, Izotope RX9 displays consistent cut off frequencies between the left and right channels of recordings 1002.MP3 and 1003.MP3. NCH Switch Plus accounts for 10% of the recordings where the left and right channels share the same cutoff frequency. SUPER v.2000 also accounts for 20% of recordings where left and right channels share the same COF. Those recordings are 1003.MP3 and 1008.MP3.

Adobe Audition 3.0.1, dBpoweramp, and FFmpeg account for 70% of the transcoders sharing the COFs in the left and right channels of the following recordings

1013.MP3

1015.MP3

1016.MP3

1017.MP3

1018.MP3

1021.MP3

1022.MP3

Additionally, Reaper v.6.25 shares left and right channel COF with Adobe Audition 3.0.1, dBpoweramp and FFmpeg on recordings 1016.MP3 and 1020.MP3. Reaper v.6.25 and SUPER v.2000 both share a left turn right cut off frequency on recording 1014.MP3

Shared COF (Reaper v6.25 and SUPER v.2000)

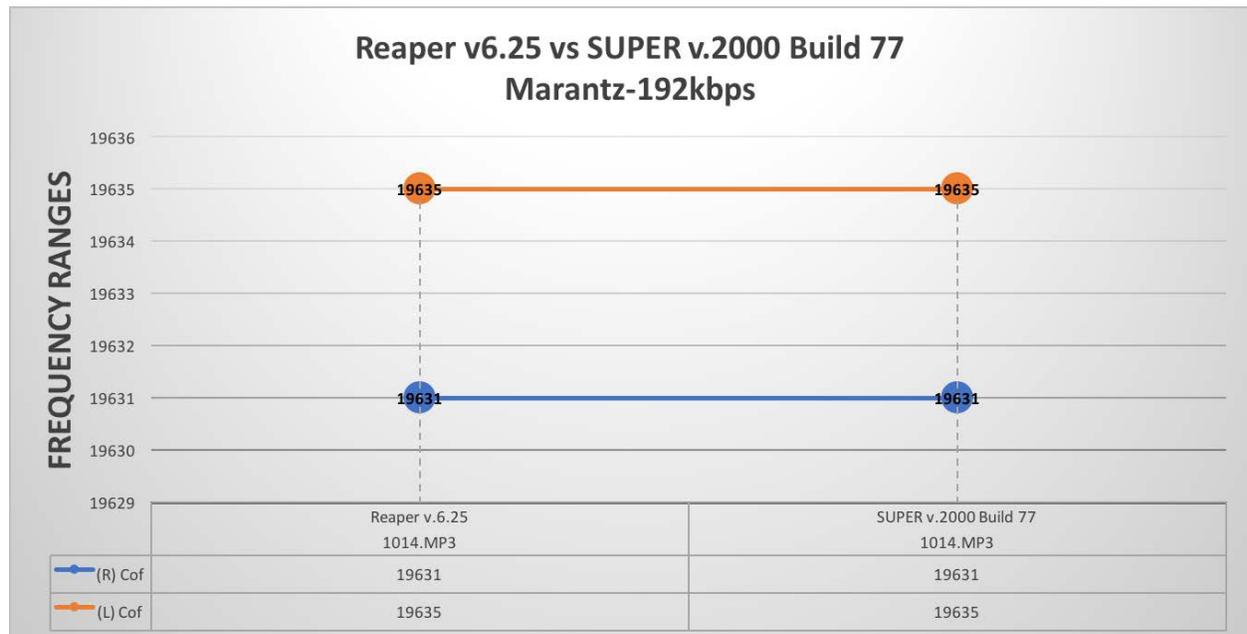

Figure 4: Reaper/SUPER shared Cut Off Frequencies Recording 1014.MP3

The analysis of file DR000315.MP3 transcodings shows variations of different cut off frequencies in the left and right channels. Some transcoders share cut off frequencies in the left or right but few share the cut off frequencies of the left and right channels. Five of the eight transcoding tools displayed the same left and right cut off frequency for file

DR000322.MP3.Shared COF of Tools

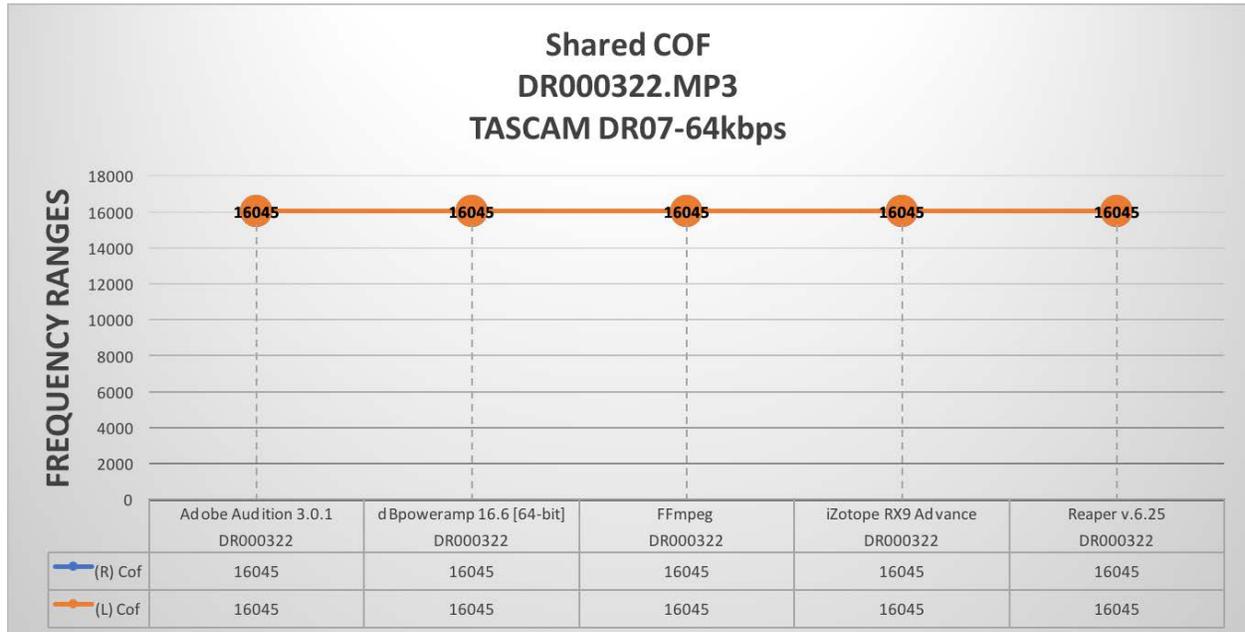

Figure 5: Adobe Audition 3.0.1, dBpoweramp 16.6, FFmpeg, RX9 Advanced, Reaper v6.25 COF(s)

SUPER also shares the cut-off frequencies of 16045/16045 but on DR000323.MP3 instead of DR000322.MP3. Izotope shares another instance of the COF match on recording DR000315.MP3. dBpoweramp and FFmpeg account for over 60% of the matched cut off frequencies in this data set.

The remaining transcoders vary in cutoff frequencies or they share cut off frequencies that are not associated with the same recording file(s).

TASCAM DR-07 128kbps

Test files DR000277.MP3 and DR000278.MP3 display no matching COFs amongst transcoders within their data sets. Some transcoding tools share the same left or right COF, but not both (per data set). FFmpeg and dBpoweramp both share the COF 16045/16044 for test file DR000279.MP3. The rest of the transcoding tools vary in their COF results for the same test

files. Analyzing Test File DR000280.MP3 presents two pairs of transcoders sharing COFs which can be seen below.

Shared COFs Test File DR000280.MP3

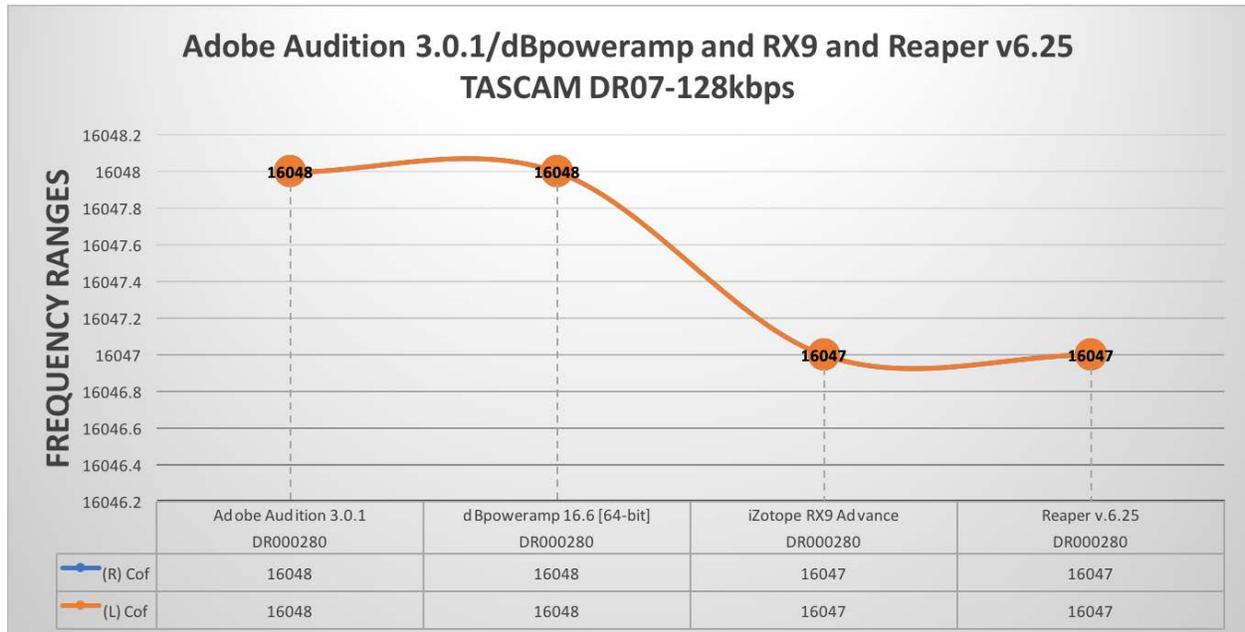

Figure 6: Adobe Audition 3.0.1, dBpoweramp, RX9, Reaper v6.25

Audition 3.01 and dBpoweramp share COFs 16048/16048 and Reaper v6.25 and RX9 share COFs of 16047/16047. These same transcoders share another set of COFs on Test File DR000286.MP3.

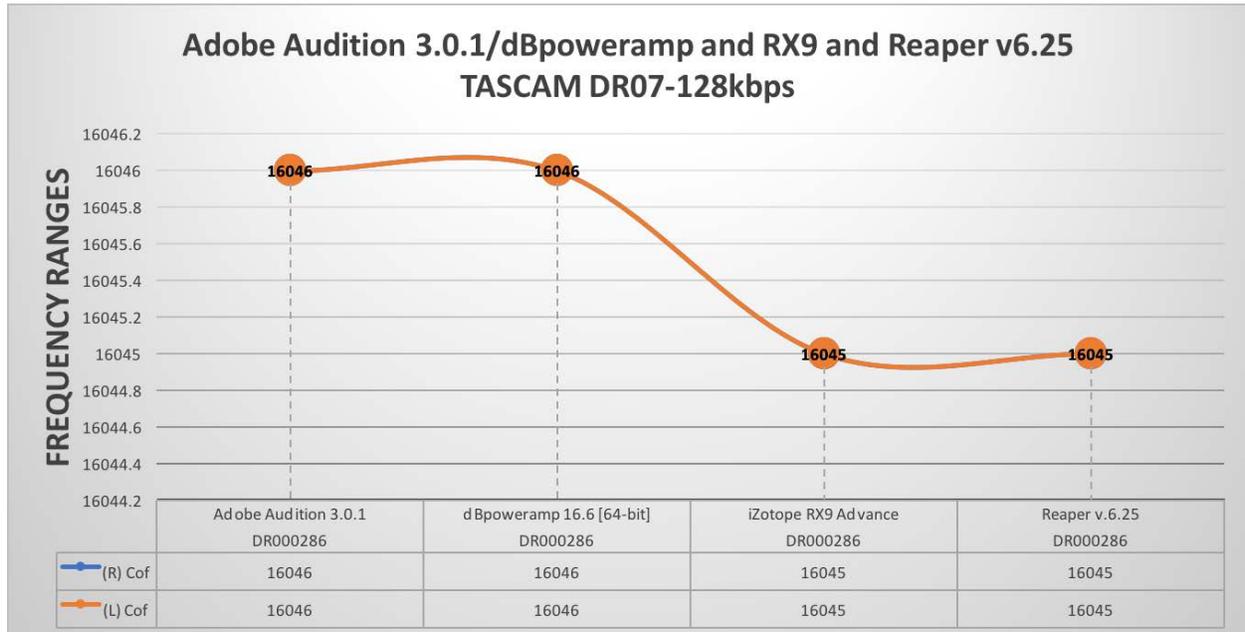

Figure 7: Adobe Audition 3.0.1, dBpoweramp, RX9, Reaper v6.25

Reaper v6.25 and Adobe Audition 2021 both share the same COF 16045/16045 but on separate test files (DR000283.MP3/DR000284.MP3). The pattern of transcoders sharing the same COF on with mismatch test files is consist within the TASCAM DR-07 12kbps data set.

TASCAM DR-07 192kbps

Here are some of the results found while analyzing transcoded files from the TASCAM DR-07 at 192 kbps.

The first test file DR000288 displays two sets of transcoders that share cut off frequencies. The transcoders in question are dBpoweramp, FFmpeg, Reaper and RX9 Advnace. The chart below outlines their COFs.

Transcoder COFs (FFmpeg, dBpoweramp, Reaper and RX9)

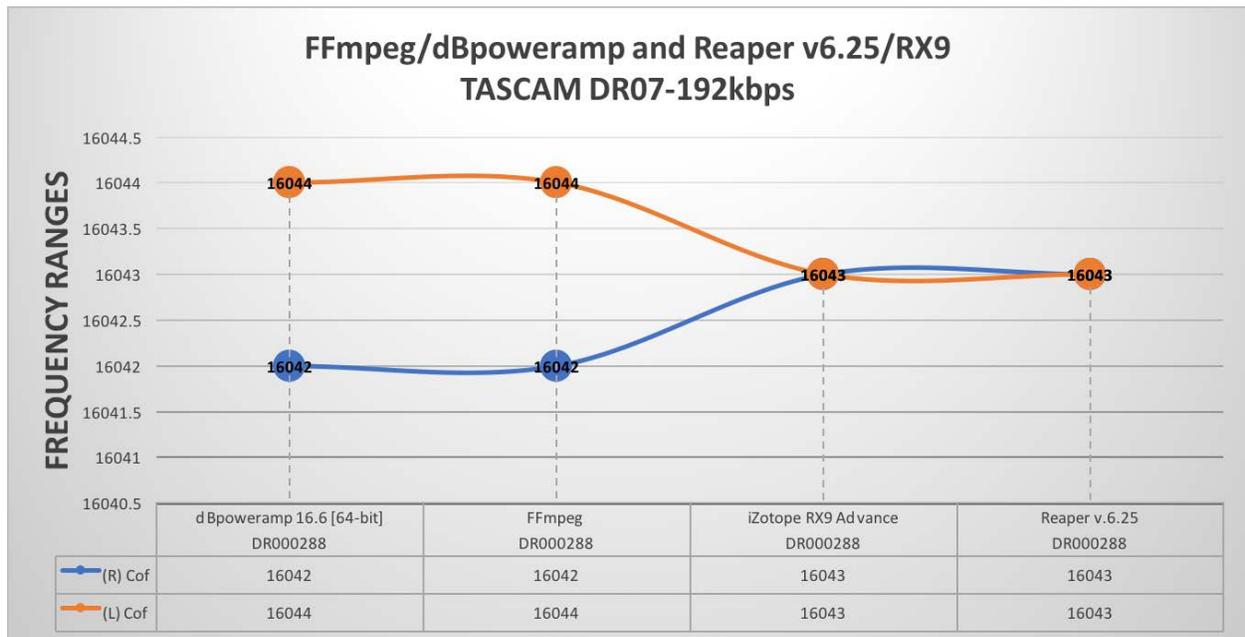

Figure 8: FFmpeg, dBpoweramp, Reaper v6.25 and Izotope RX9 Advanced Share COFs

The transcoders in figure above do not share the same COFs anywhere on any other test files within this data set. The most consistent cutoff frequencies in this data set are between FFmpeg and dBpoweramp which account for 50% of the cutoff frequency matches.

The chart below display COFs for FFmpeg and dBpoweramp

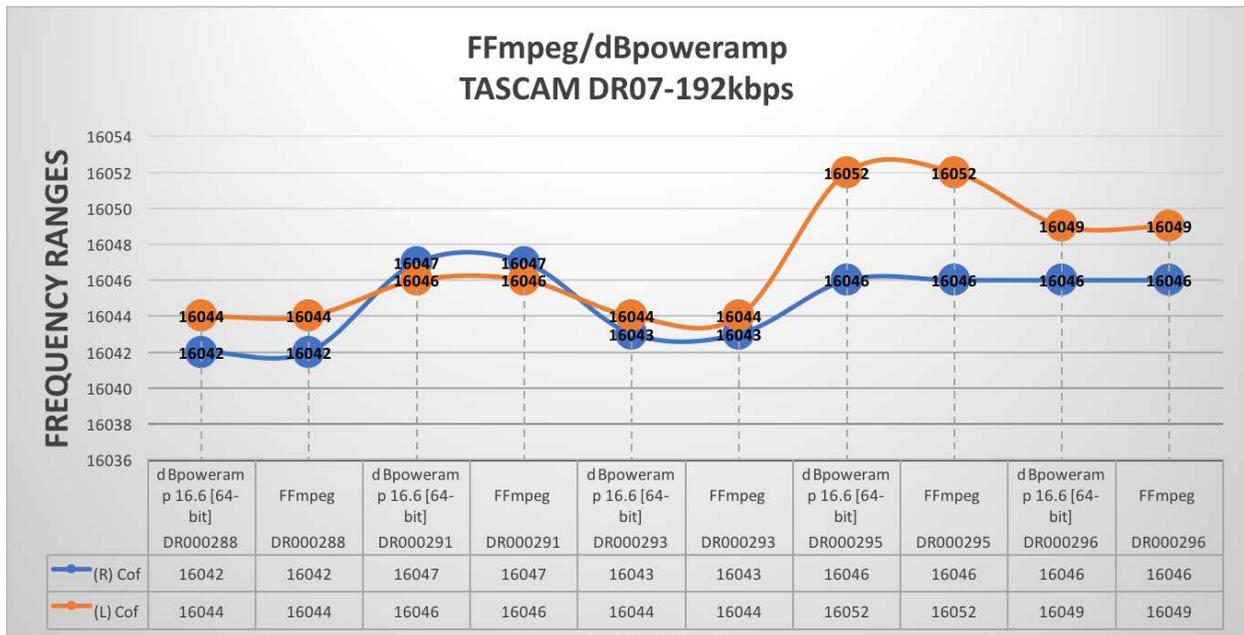

Figure 9: FFmpeg and dBpoweramp Shared COFs

The analysis conducted on the Sony PX820 stereo recordings are 128kbps and 192kbps. The 64 kbps setting did not generate stereo recordings, only mono so for that reason the 64kbps recordings were omitted from the study.

SONY ICD 128kbps

As with all recordings in the studying, there are varying cut off frequencies between the left and the right channel. Some trends that were noticed involve the consistencies between the following transcoders; Adobe Audition 3.0.1, FFmpeg, and dBpoweramp.

The consistencies in the cutoff frequencies can be seen in the chart below.

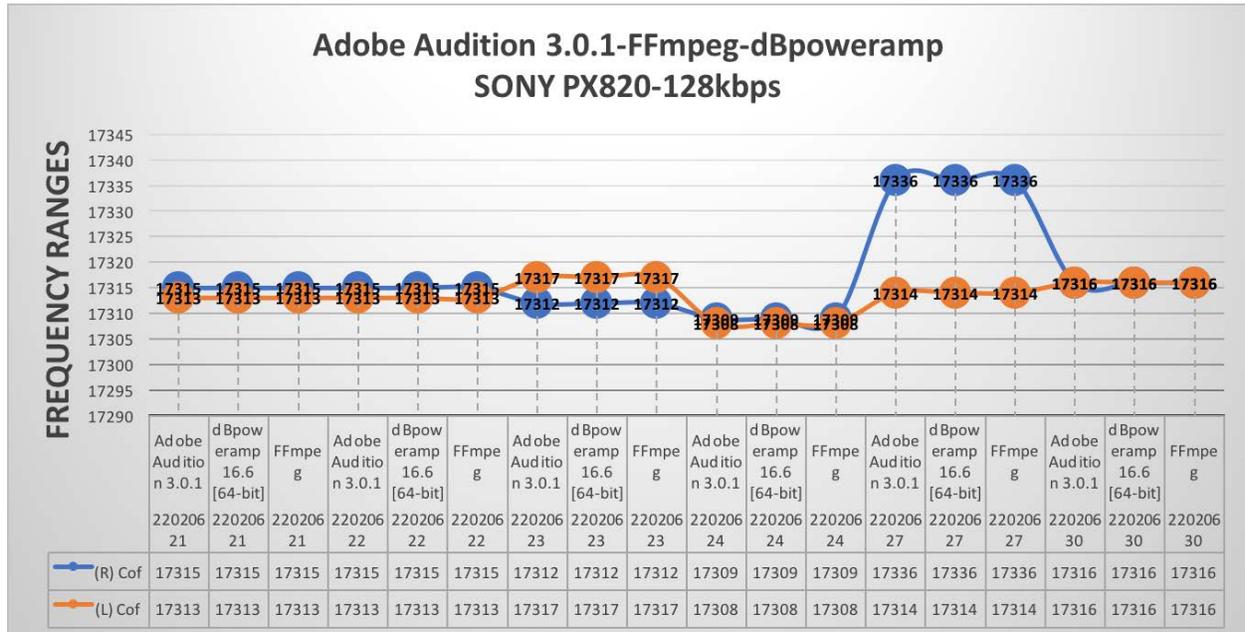

Figure 10: Adobe Audition 3.0.1, dBpoweramp, and FFmpeg COF consistencies

The transcoders displayed in the figure blank contained consistent COFs accounting for 60% of the COF matches within the data set. dBpoweramp and FFmpeg were also very consistent accounting for 70% of the COF matches within the data set. Reaper and Izotope RX9 also had consistencies but not as many as dBpoweramp, FFmpeg and Adobe Audition 3.0.1. You can see the consistencies between Reaper and RX9 in these two charts

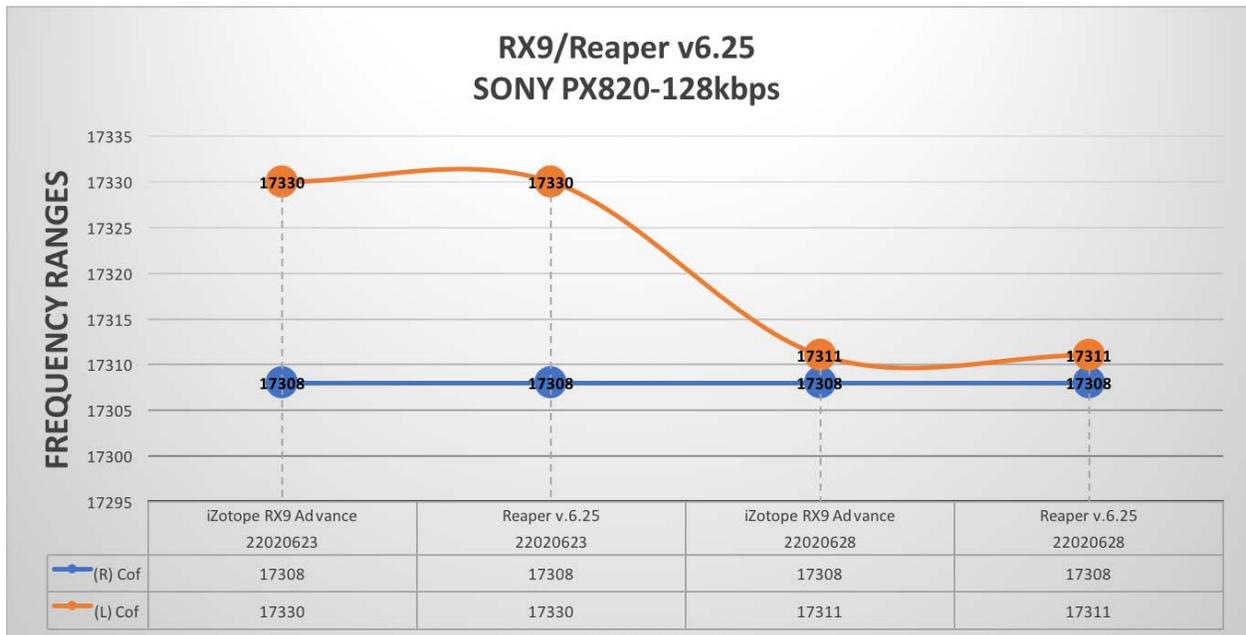

Figure 11: Reaper v6.25 and Izotope RX9 COF Matches

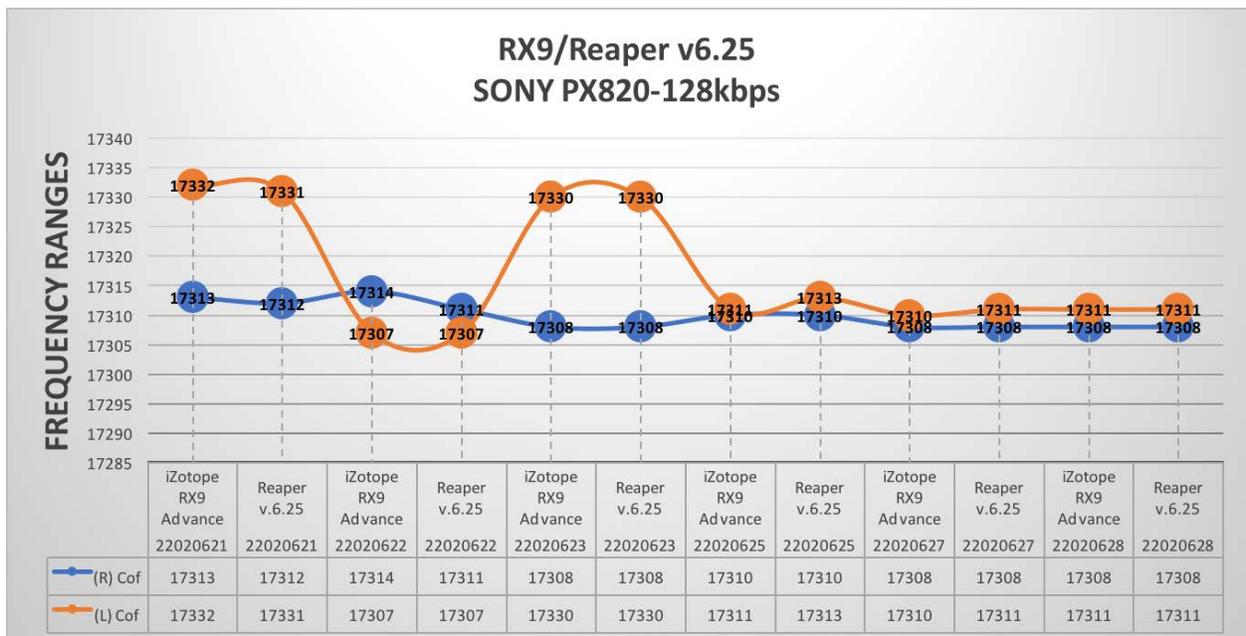

Figure 11.1: Reaper v6.25 and Izotope RX9 COF consistencies

Figure 11 shows the COF matches of cut off frequencies between 2 test recordings 22020623.MP3 and 22020628.MP3. Figure 11.1 shows a bigger picture of overall consistencies across multiple test file recordings.

SONY ICD 192kbps

The analysis results from this data set are similar to the results in the Sony 128kbps data set with a few exceptions. At 192 kbps dBpoweramp and FFmpeg account for 80% of the Matched cut-off frequencies. You can see the match COFs in the chart below

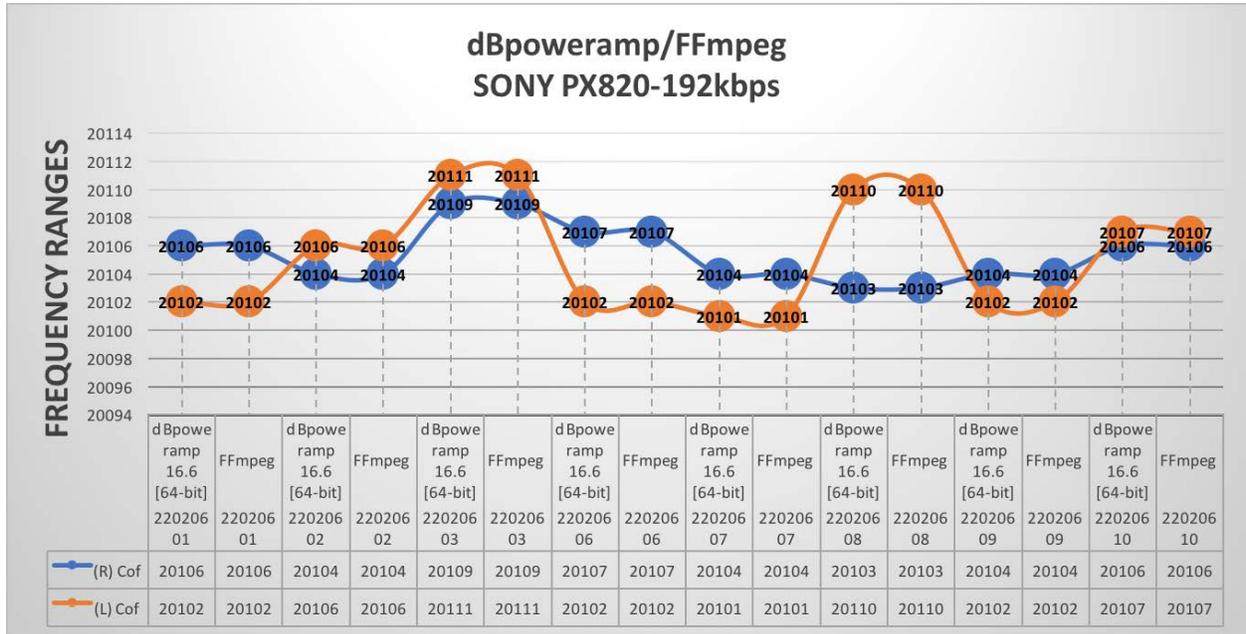

Figure 12: dBpoweramp and FFmpeg shared COF

The overall COF range is higher in this data set as well as you can see in figure 12 when compared to figure 11.1. RX9 and Reaper share two pairs of matched frequencies but at higher cut-off frequencies.

CHAPTER V

CONCLUSIONS

Conducting this research has been eye-opening. My original hypothesis was that different MP3 decoders would have a different cut-off frequency. While it is true that there are different cut-off frequencies, there were some patterns recognized more than others across all tools used within this study.

Adobe Audition 3.0.1, FFmpeg and dBpoweramp were transcoders showing the most consistency in terms of matched COFs between the left and right channel. Very rarely do the other transcoders share COFs with these three, let alone each other. There are some occasions where Reaper shared the same consistent cut off frequencies and there was one instance where five transcoders shared the same cut off frequencies but only for one subset of recordings and wasn't reproduced for the remainder of the study.

Adobe Audition 2021, FFmpeg, Reaper, and SUPER produced intermittent consistencies in the cut-off frequencies. For example, they produced the same cut-off frequencies in one recording but different cut-off frequencies in another. Other trends that were noticed revolved around consistencies in COF on individual channels and matching COFs of left and right channels, but on different test files within the same data set.

Furthermore, all transcoding applications fluctuate in COF within the same cycle of recordings. See graphics below displaying the COFs (Example Adobe Audition 3.0.1).

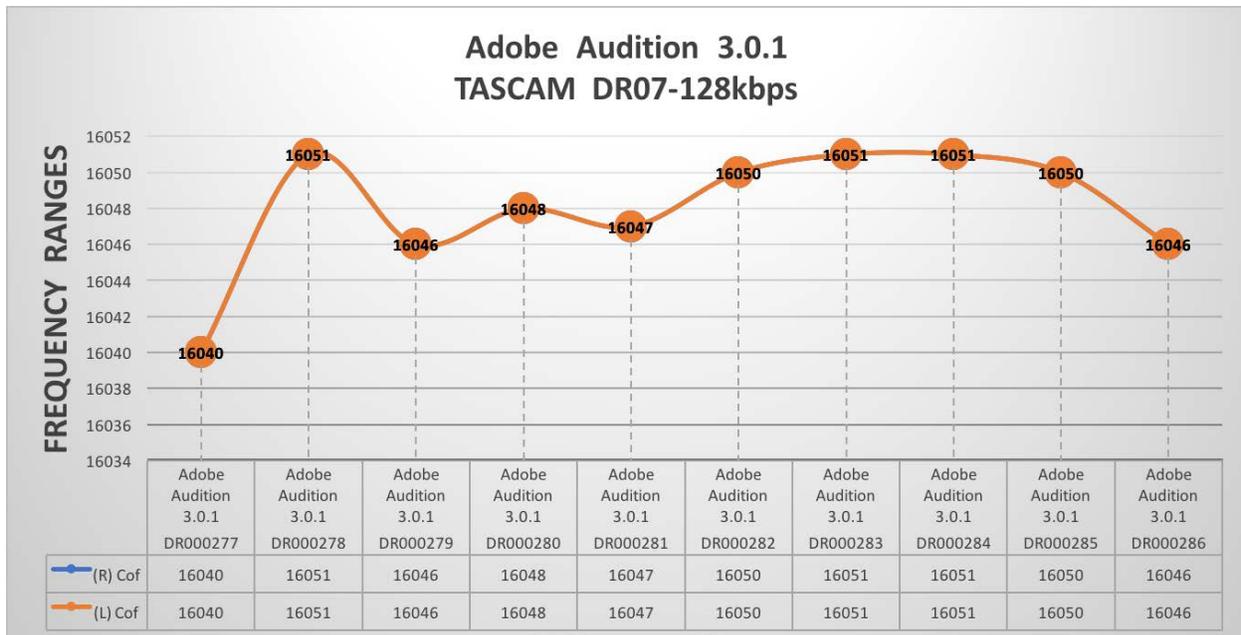

Figure 13: Adobe Audition 3.0.1 Left/Right COFs TASCAM DR07 Recordings (128kbps)

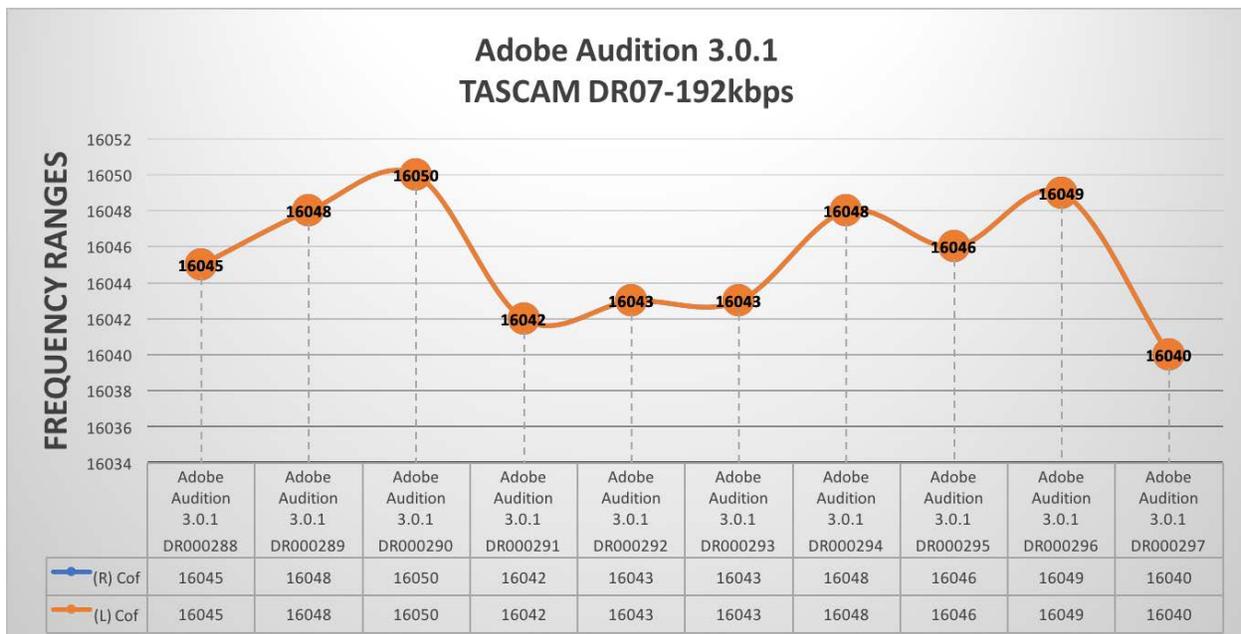

Figure 14: Adobe Audition 3.0.1 Left/Right COFs TASCAM DR07 Recordings (192kbps)

Figure 13 and 14 both display variations in COF across the recordings within the data set however, these are the only instances where the analysis results display the same frequencies within its own left and right channels.

Future Research

There are many ways that this study could be enhanced and or taken further. One way is using a more extensive test data set with multiple recorders of the same make and model. Using the same make and model recorder will allow one to see if there are any variations and anomalies between the model's initial MP3 recordings before transcoding.

Modern Handheld Recorders

Many modern recorders offer features such as; Wi-Fi control and alternative microphone positioning. The ability to position microphone capsules in the same position would allow for more accurate recordings. Wi-Fi control would allow remote recording without disturbing the recording environment or the need to physically touch the recorders between each recording cycle resulting in more accurate recordings.

As we clearly see from this study, the cutoff frequency changes based on the transcoding tool being used. More transcoders would help create a larger data set and further the study. We can combine the results of the COF with the ZLS.
